

Dantek BiblioMatik

For the pedagogical school library

Dantek BiblioMatik represents in its self a whole new generation of school library tools. It has no competent product that matches its pedagogical services and its modern facilities in the world. Dantek BiblioMatik belongs to the generation of IT that:

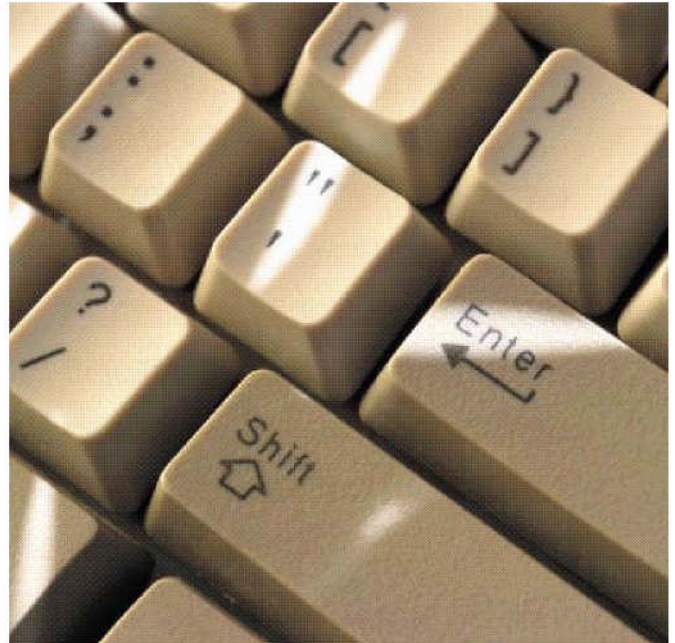

- opens new opportunities for collaboration,
- provides qualified insight in the process,
- takes individual needs into account, and
- offers efficient working methods.

All these together provide optimal support for the operation of the school library as an educational centre. Dantek BiblioMatik is different in a positive way- You become more efficient while doing your work. New possibilities are at your disposal. You can develop through your work and enjoy greater job satisfaction. As part of the process you should, at the beginning, devote some time to learning something new, but this is mainly new insight into the field of library science. The system it self is a modern product with the newest IT-technology.

Dantek BiblioMatik even takes into account trends that have characterized the duties of school librarians in recent years, so that these are now an integrated part of a well functioned educational and pedagogical centre. And alone because of the vast spreading of the internet in the past years, new opportunities have emerged opening for new possibilities for collaboration and closer relations to relevant parties, such as the library administration office in the school district, other schools and so on.

An entirely new library solution

It has been a great challenge for Dantek to add a wide range of newly developed techniques and information in the library system area, so Dantek would be able to present a system that is professional and modern.

Here are a few examples:

Dantek Bibliomatik is of course an integrated solution, where the pivotal point is the common database. This gives a better overview and coherence in solving a problem in the school library system. There is one database, where all the information is stored. The information can be accessed from different work places that are each individually optimized for the concrete job. For instance there is a school librarian's portal with enhanced help tools to support professional search tasks, including the very unique "inspired" search. There is a student search portal designed to give students quick search results in an inspiring way. One can of course still make a library search in the circulation desk module.

As a supplement to all this, Dantek has a web based library search module.

In similar, circulation desk and item management desk are 2 modules designed for the school librarian. A self service desk module is designed for the students.

Built on a whole new fundament

As a basis for these innovations in Library science, the latest knowledge in the fields of computer science is applied toward how to develop productive and easy to use systems. This means that the use of the system requires an IT knowledge corresponding to an office job level (for example, how to use word processing and spreadsheets), a qualification which all students and teachers already possess. The challenge for the school library is tied with the ability that students understand their technical relationship to the library, so they can fully profit from it. This in general would come very quickly because learning process of library terms and functions is supported by relevant tools.

Read more about the individual Dantek Library modules

There is a detailed description on each individual module in Dantek's Library solution in the following information brochures:

- Dantek BiblioMatik Circulation
- Dantek LibraryWeb
- Dantek BiblioMatik administrative tasks
